Package 'spmoran'

September 25, 2024

Type Package

Title Fast Spatial and Spatio-Temporal Regression using Moran
Eigenvectors

Version 0.3.0

Date 2024-09-24

Maintainer Daisuke Murakami <dmuraka@ism.ac.jp>

Description Functions for estimating spatio-temporally varying coefficient models, mixed models, and other spatial regression models for Gaussian and non-Gaussian data. Moran eigenvectors are used to approximate spatial and spatio-temporal processes in residuals and regression coefficients.

License GPL (>= 2)

addlearn_local   *Additional learning of local processes and prediction for large samples*

Description

This function performs an additional learning of local variations in spatially varying coefficients (SVC). While the SVC model implemented in [resf_vc](#) or [besf_vc](#) can be less accurate for large samples (e.g., n > 5,000) due to a degeneracy/over-smoothing problem, this additional learning mitigates this problem by synthesizing/averaging the model with local SVC models. The resulting spatial prediction implemented in this function is expected to be more accurate than the resf_vc function.

Note that this function is not yet supported for spatio-temporal models with !is.null(meig$coords_z).

Usage

```
addlearn_local( mod, meig0 = NULL, x0 = NULL, xconst0=NULL, xgroup0=NULL,
          cl_num=NULL, cl=NULL, parallel=FALSE, ncores=NULL )
```

Arguments

mod	Outpot from [resf_vc](#) or [besf_vc](#) function
meig0	Moran eigenvectors at prediction sites. Output from [meigen0](#)
x0	Matrix of explanatory variables at prediction sites whose coefficients are allowed to vary across geographical space (N_0 x K). Default is NULL
xconst0	Matrix of explanatory variables at prediction sites whose coefficients are assumed constant (or NVC) across space (N_0 x K_const). Default is NULL
xgroup0	Matrix of group indeces at prediction sites that may be group IDs (integers) or group names (N_0 x K_g). Default is NULL

cl_num	Number of local sub-models being aggregated/averaged. If NULL, the number is determined so that the number of samples per sub-model equals approximately 600. Default is NULL
cl	Vector of cluster ID for each sample (N x 1). If specified, the local sub-models are given by this ID. If NULL, k-means clustering based on spatial coordinates is performed to obtain spatial clusters each of which contain approximately 600 samples. Default is NULL
parallel	If TRUE, the model is estimated through parallel computation. The default is FALSE if mod is an [resf_vc](#) object while TRUE if mod is an [besf_vc](#) object
ncores	Number of cores used for the parallel computation. If ncores = NULL and parallel = TRUE, the number of available cores - 2 is used. Default is NULL

Value

b_vc	Matrix of estimated spatially varying coefficients (SVCs) on x (N x K)
bse_vc	Matrix of standard errors for the SVCs on x (N x k)
z_vc	Matrix of z-values for the SVCs on x (N x K)
p_vc	Matrix of p-values for the SVCs on x (N x K)
c	Matrix with columns for the estimated coefficients on xconst, their standard errors, z-values, and p-values (K_c x 4)
b_g	List of K_g matrices with columns for the estimated group effects, their standard deviations, and t-values
s	List of 2 elements summarizing variance parameters characterizing SVCs of each local sub-model. The first element contains standard deviations of each SVCs while the second elementcontains their Moran's I values that are scaled to take a value between 0 (no spatial dependence) and 1 (strongest positive spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
s_global	The same variance parameters for the globa sub-model
s_g	Vector of standard deviations of the group effects
e	Error statistics. It includes residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC)
pred	Matrix of predicted values for y (pred) and their standard errors (pred_se) (N x 2)
resid	Vector of residuals (N x 1)
cl	Vector of cluster ID being used (N x 1)
pred0	Matrix of predicted values for y (pred) and their standard errors (pred_se) at prediction sites (N_0 x 2)
b_vc0	Matrix of estimated spatially varying coefficients (SVCs) at prediction sites (N_0 x K)
bse_vc0	Matrix of standard errors for the SVCs at prediction sites (N_0 x k)

z_vc0	Matrix of z-values for the SVCs at prediction sites (N x K)
p_vc0	Matrix of p-values for the SVCs at prediction sites (N x K)
other	List of other outputs, which are internally used

besf   *Spatial regression with RE-ESF for very large samples*

Description

Parallel and memory-free implementation of RE-ESF-based spatial regression for very large samples. This model estimates residual spatial dependence, constant coefficients, and non-spatially varying coefficients (NVC; coefficients varying with respect to explanatory variable value).

Usage

```
besf( y, x = NULL, nvc = FALSE, nvc_sel = TRUE, coords, s_id = NULL,
      covmodel="exp", enum = 200, method = "reml", penalty = "bic", nvc_num = 5,
      maxiter = 30, bsize = 4000, ncores = NULL )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K)
nvc	If TRUE, NVCs are assumed on x. Otherwise, constant coefficients are assumed. Default is FALSE
nvc_sel	If TRUE, type of coefficients (NVC or constant) is selected through a BIC (default) or AIC minimization. If FALSE, NVCs are assumed across x. Alternatively, nvc_sel can be given by column number(s) of x. For example, if nvc_sel = 2, the coefficient on the second explanatory variable in x is NVC and the other coefficients are constants. The Default is TRUE
coords	Matrix of spatial point coordinates (N x 2)
s_id	Optional. ID specifying groups modeling spatially dependent process (N x 1). If it is specified, group-level spatial process is estimated. It is useful. e.g., for multilevel modeling (s_id is given by the group ID) and panel data modeling (s_id is given by individual location id). Default is NULL

covmodel	Type of kernel to model spatial dependence. The currently available options are "exp" for the exponential kernel, "gau" for the Gaussian kernel, and "sph" for the spherical kernel
enum	Number of Moran eigenvectors to be used for spatial process modeling (scalar). Default is 200
method	Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"
penalty	Penalty to select type of coefficients (NVC or constant) to stablize the estimates. The current options are "bic" for the Baysian information criterion-type penalty (N x log(K)) and "aic" for the Akaike information criterion (2K) (see Muller et al., 2013). Default is "bic"
nvc_num	Number of basis functions used to model NVC. An intercept and nvc_num natural spline basis functions are used to model each NVC. Default is 5
maxiter	Maximum number of iterations. Default is 30
bsize	Block/badge size. bsize x bsize elements are iteratively processed during the parallelized computation. Default is 4000
ncores	Number of cores used for the parallel computation. If ncores = NULL, the number of available cores - 2 is detected and used. Default is NULL

Value

b	Matrix with columns for the estimated coefficients on x, their standard errors, z-values, and p-values (K x 4). Effective if nvc =FALSE
c_vc	Matrix of estimated NVCs on x (N x K). Effective if nvc =TRUE
cse_vc	Matrix of standard errors for the NVCs on x (N x K). Effective if nvc =TRUE
ct_vc	Matrix of t-values for the NVCs on x (N x K). Effective if nvc =TRUE
cp_vc	Matrix of p-values for the NVCs on x (N x K). Effective if nvc =TRUE
s	Vector of estimated variance parameters (2 x 1). The first and the second elements denote the standard deviation and the Moran's I value of the estimated spatially dependent component, respectively. The Moran's I value is scaled to take a value between 0 (no spatial dependence) and 1 (the maximum possible spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
e	Vector whose elements are residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). When method = "ml", restricted log-likelihood (rlogLik) is replaced with log-likelihood (logLik)
vc	List indicating whether NVC are removed or not during the BIC/AIC minimization. 1 indicates not removed whreas 0 indicates removed
r	Vector of estimated random coefficients on Moran's eigenvectors (L x 1)
sf	Vector of estimated spatial dependent component (N x 1)
pred	Vector of predicted values (N x 1)
resid	Vector of residuals (N x 1)
other	List of other outputs, which are internally used

besf_vc | *Spatially and non-spatially varying coefficient (SNVC) modeling for very large samples*

Description

Parallel and memory-free implementation of SNVC modeling for very large samples. The model estimates residual spatial dependence, constant coefficients, spatially varying coefficients (SVCs), non-spatially varying coefficients (NVC; coefficients varying with respect to explanatory variable value), and SNVC (= SVC + NVC). Type of coefficients can be selected through BIC/AIC minimization. By default, it estimates a SVC model. SNVCs can be mapped just like SVCs. Unlike SVC models, SNVC model is robust against spurious correlation (multicollinearity), so, stable (see Murakami and Griffith, 2020). This function is not yet supported for spatio-temporal modeling.

Note: The SVC model can be less accurate for large samples due to a degeneracy/over-smoothing problem (see Murakami et al., 2023). The `addlearn_local` is useful to mitigate this problem (See the coding example below).

Usage

```
besf_vc( y, x, xconst = NULL, coords, s_id = NULL, x_nvc = FALSE, xconst_nvc = FALSE,
         x_sel = TRUE, x_nvc_sel = TRUE, xconst_nvc_sel = TRUE, nvc_num=5,
         method = "reml", penalty = "bic", maxiter = 30, tol = 1e-30,
                      covmodel="exp",enum = 200, bsize = 4000, ncores=NULL )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables with spatially varying coefficients (SVC) (N x K)
xconst	Matrix of explanatory variables with constant coefficients (N x K_c). Default is NULL
coords	Matrix of spatial point coordinates (N x 2)
s_id	Optional. ID specifying groups modeling spatially dependent process (N x 1). If it is specified, group-level spatial process is estimated. It is useful for multilevel modeling (s_id is given by the group ID) and panel data modeling (s_id is given by individual location id). Default is NULL
x_nvc	If TRUE, SNVCs are assumed on x. Otherwise, SVCs are assumed. Default is FALSE
xconst_nvc	If TRUE, NVCs are assumed on xconst. Otherwise, constant coefficients are assumed. Default is FALSE
x_sel	If TRUE, type of coefficient (SVC or constant) on x is selected through a BIC (default) or AIC minimization. If FALSE, SVCs are assumed across x. Alternatively, x_sel can be given by column number(s) of x. For example, if x_sel = 2, the coefficient on the second explanatory variable in x is SVC and the other coefficients are constants. The Default is TRUE
x_nvc_sel	If TRUE, type of coefficient (NVC or constant) on x is selected through the BIC (default) or AIC minimization. If FALSE, NVCs are assumed across x. Alternatively, x_nvc_sel can be given by column number(s) of x. For example, if x_nvc_sel = 2, the coefficient on the second explanatory variable in x is NVC and the other coefficients are constants. The Default is TRUE

xconst_nvc_sel	If TRUE, type of coefficient (NVC or constant) on xconst is selected through the BIC (default) or AIC minimization. If FALSE, NVCs are assumed across xconst. Alternatively, xconst_nvc_sel can be given by column number(s) of xconst. For example, if xconst_nvc_sel = 2, the coefficient on the second explanatory variable in xconst is NVC and the other coefficients are constants.The Default is TRUE
nvc_num	Number of basis functions used to model NVC. An intercept and nvc_num natural spline basis functions are used to model each NVC. Default is 5
method	Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"
penalty	Penalty to select type of coefficients (SNVC, SVC, NVC, or constant) to stablize the estimates. The current options are "bic" for the Baysian information criterion-type penalty $(N \times \log(K))$ and "aic" for the Akaike information criterion $(2K)$ (see Muller et al., 2013). Default is "bic"
maxiter	Maximum number of iterations. Default is 30
tol	The tolerance for matrix inversion. Some errors regarding singular fit can be avoided by reducing the value, but the output can be unstable. Default is 1e-30
covmodel	Type of kernel to model spatial dependence. The currently available options are "exp" for the exponential kernel, "gau" for the Gaussian kernel, and "sph" for the spherical kernel
enum	Number of Moran eigenvectors to be used for spatial process modeling (scalar). Default is 200
bsize	Block/badge size. bsize x bsize elements are iteratively processed during the parallelized computation. Default is 4000
ncores	Number of cores used for the parallel computation. If ncores = NULL, the number of available cores - 2 is detected and used. Default is NULL

Value

b_vc	Matrix of estimated SNVC (= SVC + NVC) on x (N x K)
bse_vc	Matrix of standard errors for the SNVCs on x (N x k)
z_vc	Matrix of z-values for the SNVCs on x (N x K)
p_vc	Matrix of p-values for the SNVCs on x (N x K)
B_vc_s	List summarizing estimated SVCs (in SNVC) on x. The four elements are the SVCs (N x K), the standard errors (N x K), z-values (N x K), and p-values (N x K), respectively
B_vc_n	List summarizing estimated NVCs (in SNVC) on x. The four elements are the NVCs (N x K), the standard errors (N x K), z-values (N x K), and p-values (N x K), respectively
c	Matrix with columns for the estimated coefficients on xconst, their standard errors, z-values, and p-values (K_c x 4). Effective if xconst_nvc = FALSE
c_vc	Matrix of estimated NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE
cse_vc	Matrix of standard errors for the NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE

cz_vc	Matrix of z-values for the NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE
cp_vc	Matrix of p-values for the NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE
s	List of variance parameters in the SNVC (SVC + NVC) on x. The first element is a 2 x K matrix summarizing variance parameters for SVC. The (1, k)-th element is the standard deviation of the k-th SVC, while the (2, k)-th element is the Moran's I value that is scaled to take a value between 0 (no spatial dependence) and 1 (strongest spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked. The second element of s is the vector of standard deviations of the NVCs
s_c	Vector of standard deviations of the NVCs on xconst
vc	List indicating whether SVC/NVC are removed or not during the BIC/AIC minimization. 1 indicates not removed (replaced with constant) whreas 0 indicates removed
e	Vector whose elements are residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). When method = "ml", restricted log-likelihood (rlogLik) is replaced with log-likelihood (logLik)
pred	Vector of predicted values (N x 1)
resid	Vector of residuals (N x 1)
other	List of other outputs, which are internally used

esf   *Spatial regression with eigenvector spatial filtering*

Description

This function estimates the linear eigenvector spatial filtering (ESF) model. The eigenvectors are selected by a forward stepwise method.

Usage

```
esf( y, x = NULL, vif = NULL, meig, fn = "r2" )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K). Default is NULL
vif	Maximum acceptable value of the variance inflation factor (VIF) (scalar). For example, if vif = 10, eigenvectors are selected so that the maximum VIF value among explanatory variables and eigenvectors is equal to or less than 10. Default is NULL
meig	Moran eigenvectors and eigenvalues. Output from meigen or meigen_f
fn	Objective function for the stepwise eigenvector selection. The adjusted R2 ("r2"), AIC ("aic"), or BIC ("bic") are available. Alternatively, all the eigenvectors in meig are used without the stepwise selection if fn = "all". This is acceptable for large samples (see Murakami and Griffith, 2019). Default is "r2"

Value

b	Matrix with columns for the estimated coefficients on x, their standard errors, t-values, and p-values (K x 4)
s	Vector of statistics for the estimated spatial component (2 x 1). The first element is the standard deviation and the second element is the Moran's I value of the estimated spatially dependent component. The Moran's I value is scaled to take a value between 0 (no spatial dependence) and 1 (the maximum possible spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
r	Matrix with columns for the estimated coefficients on Moran's eigenvectors, their standard errors, t-values, and p-values (L x 4)
vif	Vector of variance inflation factors of the explanatory variables (N x 1)
e	Vector whose elements are residual standard error (resid_SE), adjusted R2 (adjR2), log-likelihood (logLik), AIC, and BIC
sf	Vector of estimated spatial dependent component ($E\gamma$) (N x 1)
pred	Vector of predicted values (N x 1)
resid	Vector of residuals (N x 1)
other	List of other outputs, which are internally used

lsem   *Low rank spatial error model (LSEM) estimation*

Description

This function estimates the low rank spatial error model.

Usage

```
lsem( y, x, weig, method = "reml" )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K)
weig	eigenvectors and eigenvalues of a spatial weight matrix. Output from weigen
method	Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"

Value

b	Matrix with columns for the estimated coefficients on x, their standard errors, t-values, and p-values (K x 4)
s	Vector of estimated variance parameters (2 x 1). The first and the second elements denote the estimated rho parameter (sp_lambda) quantfying the scale of spatial dependent process, and the standard error of the process (sp_SE), respectively.

e	Vector whose elements are residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). When method = "ml", restricted log-likelihood (rlogLik) is replaced with log-likelihood (logLik)
r	Vector of estimated random coefficients on the spatial eigenvectors (L x 1)
pred	Vector of predicted values (N x 1)
resid	Vector of residuals (N x 1)
other	List of other outputs, which are internally used

lslm   *Low rank spatial lag model (LSLM) estimation*

Description

This function estimates the low rank spatial lag model.

Usage

```
lslm( y, x, weig, method = "reml", boot = FALSE, iter = 200 )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K)
weig	eigenvectors and eigenvalues of a spatial weight matrix. Output from weigen
method	Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"
boot	If it is TRUE, confidence intervals for the spatial dependence parameters (s), the mean direct effects (de), and the mean indirect effects (ie), are estimated through a parametric bootstrapping. Default is FALSE
iter	The number of bootstrap replicates. Default is 200

Value

b	Matrix with columns for the estimated coefficients on x, their standard errors, t-values, and p-values (K x 4)
s	Vector of estimated shrinkage parameters (2 x 1). The first and the second elements denote the estimated rho parameter (sp_rho) quantfying the scale of spatial dependence, and the standard error of the spatial dependent component (sp_SE), respectively. If boot = TRUE, their 95 percent confidence intervals and the resulting p-values are also provided
e	Vector whose elements are residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). When method = "ml", restricted log-likelihood (rlogLik) is replaced with log-likelihood (logLik)
de	Matrix with columns for the estimated mean direct effects on x. If boot = TRUE, their 95 percent confidence intervals and the resulting p-values are also provided
ie	Matrix with columns for the estimated mean indirect effects on x. If boot = TRUE, their 95 percent confidence intervals and the resulting p-values are also provided
r	Vector of estimated random coefficients on the spatial eigenvectors (L x 1)
pred	Vector of predicted values (N x 1)
resid	Vector of residuals (N x 1)
other	List of other outputs, which are internally used

meigen   *Extraction of Moran eigenvectors*

Description

This function extracts spatial and temporal eigenvectors (i.e., basis functions describing spatial and temporal patterns).

Usage

```
meigen( coords = NULL,model = "exp", enum = NULL, s_id = NULL,
        threshold = 0, cmat = NULL, coords_z=NULL, enum_z=NULL,
        interact=TRUE, interact_max_dim = 600  )
```

Arguments

coords	Matrix of spatial coordinates (N x 2). If cmat is specified, it is ignored
model	Type of kernel to model spatial dependence. The currently available options are "exp" for the exponential kernel, "gau" for the Gaussian kernel, and "sph" for the spherical kernel. Default is "exp"
enum	Optional. The maximum mumber of spatial eigenvectors to be extracted (scalar)
s_id	Optional. Location/zone ID for modeling inter-group spatial effects. If specified, Moran eigenvectors are extracted by groups. It is useful e.g. for multilevel modeling (s_id is the groups) and panel data modeling (s_id is given by individual location id). Default is NULL
threshold	Optional. Threshold for the eigenvalues. Suppose that lambda_1 is the maximum eigenvalue, this function extracts eigenvectors whose corresponding eigenvalue is equal or greater than (threshold x lambda_1). threshold must be a value between 0 and 1. Default is zero (see Details)
cmat	Optional. A user-specified spatial connectivity matrix (N x N). It must be provided when the user wants to use a spatial connectivity matrix other than the default matrices

coords_z	Optional. One- or two-column matrix whose t-th column represents t-th temporal coordinate (N x 1 or N x 2).
enum_z	Optional. The maximum mumber of temporal eigenvectors to be extracted (scalar)
interact	Optional. If TRUE, space-time eigenvectors (space x time) are considered in addition to spatial eigenvectors and temporal eigenvectors
interact_max_dim	
	Optional. The maximum mumber of the space-time eigenvectors to be extracted (scalar)

Details

This function extracts spatial eigenvectors from MCM, where M = I - 11'/N is a centering operator. By default, C is a N x N connectivity matrix whose (i, j)-th element equals exp(-d(i,j)/h), where d(i,j) is the spatial Euclidean distance between the sample sites i and j. h is the maximum length of the minimum spanning tree connecting sample sites (see Dray et al., 2006). If cmat is provided, this function performs the same calculation after C is replaced with cmat.

The temporal eigenvectors are extracted in the same way where the spatial distance d(i,j) is replaced with temporal difference. If two temporal coordinates are given, their eigenvectors are evaluated respectively.

If threshold = 0.00 (default), all the eigenvectors corresponding to positive eigenvalues explaining positive spatial/temporal dependence are extracted. threshold = 0.00 or 0.25 are standard assumptions (see Griffith, 2003; Murakami and Griffith, 2015).

Value

sf	Matrix of the spatial eigenvectors (N x L)
ev	Vector of the spatial eigenvalues (L x 1), scaled to have the maximum value of 1
sf_z	List. t-th element is the matrix of the t-th temporal eigenvectors (N x L_t)
ev_z	List. t-th element is the vector of the t-th temporal eigenvalues (L_t x 1), scaled to have the maximum value of 1
other	List of other outcomes, which are internally used

meigen0   *Nystrom extension of Moran eigenvectors*

Description

This function estimates Moran eigenvectors at unobserved sites using the Nystrom extension.

Usage

```
meigen0( meig, coords0, coords_z0 = NULL, s_id0 = NULL )
```

Arguments

meig	Moran eigenvectors and eigenvalues. Output from [meigen](#) or [meigen_f](#)
coords0	Matrix of spatial point coordinates of prediction sites (N_0 x 2)
coords_z0	Optional. One- or two-column matrix whose t-th column represents the t-th temporal coordinate of prediction times (N_0 x 1 or N_0 x 2).
s_id0	Optional. ID specifying groups modeling spatial effects (N_0 x 1). If specified, Moran eigenvectors are extracted by groups. It is useful e.g. for multilevel modeling (s_id is the groups) and panel data modeling (s_id is given by individual location id). Default is NULL

Value

sf	Matrix of the first L eigenvectors at unobserved sites (N_0 x L)
ev	Vector of the first L eigenvalues (L x 1)
sf_z	List. t-th element is the matrix of the t-th temporal eigenvectors (N x L_t)
ev_z	List. t-th element is the vector of the t-th temporal eigenvalues (L_t x 1)
other	List of other outputs, which are internally used

meigen_f   *Fast approximation of Moran eigenvectors*

Description

This function approximates spatial and temporal eigenvectors (i.e., basis functions describing spatial and temporal patterns) computationally efficiently.

Usage

```
meigen_f( coords, model = "exp", enum = 200, s_id = NULL, threshold = 0,
          coords_z = NULL, enum_z = 200, interact = TRUE,
          interact_max_dim = 600 )
```

Arguments

coords	Matrix of spatial coordinates (N x 2)
model	Type of kernel to model spatial dependence. The currently available options are "exp" for the exponential kernel, "gau" for the Gaussian kernel, and "sph" for the spherical kernel. Default is "exp"
enum	Number of eigenvectors and eigenvalues to be extracted (scalar). Default is 200
s_id	Optional. Location/zone ID for modeling inter-group spatial effects. If specified, Moran eigenvectors are extracted by groups. It is useful e.g. for multilevel modeling (s_id is the groups) and panel data modeling (s_id is given by individual location id). Default is NULL
threshold	Optional. Threshold for the eigenvalues. Suppose that lambda_1 is the maximum eigenvalue, this function extracts eigenvectors whose corresponding eigenvalue is equal or greater than (threshold x lambda_1). threshold must be a value between 0 and 1. Default is zero
coords_z	Optional. One- or two-column matrix of temporal coordinates (N x 1 or N x 2).
enum_z	Optional. The maximum number of temporal eigenvectors to be extracted (scalar)
interact	Optional. If TRUE, space-time eigenvectors (space x time) are considered in addition to spatial eigenvectors and temporal eigenvectors
interact_max_dim	
	Optional. The maximum mumber of the space-time eigenvectors to be extracted (scalar)

Details

This function extracts approximated spatial eigenvectors from MCM. M = I - 11'/N is a centering operator, and C is a spatial connectivity matrix whose (i, j)-th element is given by exp(-d(i,j)/h), where d(i,j) is the Euclidean distance between the sample sites i and j, and h is a range parameter given by the maximum length of the minimum spanning tree connecting sample sites (see Dray et al., 2006). Following a simulation result in Murakami and Griffith (2019), this function approximates the 200 eigenvectors corresponding to the 200 largest eigenvalues by default (i.e., enum = 200). If enum is given by a smaller value like 100, the computation time will be shorter, but with greater approximation error.

The temporal eigenvectors are extracted in the same way where the spatial distance d(i,j) is replaced with temporal difference. If two temporal coordinates are given, their eigenvectors are evaluated respectively.

Value

sf	Matrix of the spatial eigenvectors (N x L)
ev	Vector of the spatial eigenvalues (L x 1), scaled to have the maximum value of 1
sf_z	List. t-th element is the matrix of the t-th temporal eigenvectors (N x L_t)
ev_z	List. t-th element is the vector of the t-th temporal eigenvalues (L_t x 1), scaled to have the maximum value of 1
other	List of other outcomes, which are internally used

nongauss_y	*Parameter setup for modeling non-Gaussian continuous data and count data*

Description

Parameter setup for modeling non-Gaussian continuous data and count data. The SAL transformation (see details) is used to model a wide variety of non-Gaussian data without explicitly assuming data distribution (see Murakami et al., 2021 for further detail). In addition, Box-Cox transformation is used for non-negative continuous variables while another transformation approximating overdispersed Poisson distribution is used for count variables. The output from this function is used as an input of the resf and resf_vc functions. For further details about its implementation and case study examples, see Murakami (2021).

Usage

```
nongauss_y( y_type = "continuous", y_nonneg = FALSE, tr_num = 0 )
```

Arguments

y_type	Type of explained variables y. "continuous" for continuous variables and "count" for count variables
y_nonneg	Effective if y_type = "continuous". TRUE if y cannot take negative value. If y_nonneg = TRUE and tr_num = 0, the Box-Cox transformation is applied to y. If y_nonneg = TRUE and tr_num > 0, the Box-Cox transformation is applied first to roughly Gaussianize y. Then, the SAL transformation is iterated tr_num times to improve the modeling accuracy. Default is FALSE
tr_num	Number of the SAL transformations (SinhArcsinh and Affine, where the use of "L" stems from the "Linear") applied to Gaussianize y. Default is 0

Details

If tr_num >0, the SAL transformation is iterated tr_num times to Gaussianize y. The SAL transformation is defined as SAL(y)=a+b*sinh(c*arcsinh(y)-d) where a,b,c,d are parameters. Based on Rios and Tobar (2019), the iteration of the SAL transformation approximates a wide variety of non-Gaussian distributions without explicitly assuming data distribution. The resf and resf_vc functions return tr_par, which is a list whose k-th element includes the a,b,c,d parameters used for the k-th SAL transformation.

In addition, for non-negative y (y_nonneg = TRUE), the Box-Cox transformation is applied prior to the iterative SAL transformation. tr_num and y_nonneg can be selected by comparing the BIC (or AIC) values across models. This compositionally-warped spatial regression approach is detailed in Murakami et al. (2021).

For count data (y_type = "count"), an overdispersed Poisson distribution (Gaussian approximation) is assumed. If tr_num > 0, the distribution is adjusted to fit the data (y) through the iterative SAL transformations. y_nonneg is ignored if y_type = "count".

Value

    nongauss   List of parameters for modeling non-Gaussian data

plot_n   *Plot non-spatially varying coefficients (NVCs)*

Description

This function plots non-spatially varying coefficients (NVCs; coefficients varying with respect to explanatory variable value) and their 95 percent confidence intervals

Usage

```
plot_n( mod, xnum = 1, xtype = "x", cex.lab = 20,
        cex.axis = 15, lwd = 1.5, ylim = NULL, nmax = 20000 )
```

Arguments

mod	Outpot from [resf](#), [besf](#), [resf_vc](#), or [besf_vc](#) function
xnum	The NVC on the xnum-th explanatory variable is plotted. Default is 1
xtype	Effective for [resf_vc](#) and [besf_vc](#). If "x", the num-th NVC in the spatially and non-spatially varying coefficients on x is plotted. If "xconst", the num-th NVC on xconst is plotted. Default is "x"
cex.lab	The size of the x and y axis labels
cex.axis	The size of the tick label numbers
lwd	The width of the line drawing the coefficient estimates
ylim	The limints of the y-axis
nmax	If sample size exceeds nmax, nmax samples are randomly selected and plotted. Default is 20,000

---

plot_qr   *Plot quantile regression coefficients estimated from SF-UQR*

Description

This function plots regression coefficients estimated from the spatial filter unconditional quantile regression (SF-UQR) model.

Usage

```
plot_qr( mod, pnum = 1, par = "b", cex.main = 20, cex.lab = 18, cex.axis = 15, lwd = 1.5 )
```

Arguments

mod	Outpot from the [resf_qr](#) function
pnum	A number specifying the parameter being plotted. If par = "b", the coefficients on the pnum-th explanatory variable are plotted (intercepts are plotted if pnum = 1). If par = "s" and pnum = 1, the estimated standard errors for the reidual spatial process are plotted. If par = "s" and pnum = 2, the Moran's I values of the residual spatial process are plotted. The Moran's I value is scaled to take a value between 0 (no spatial dependence) and 1 (the maximum possible spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
par	If it is "b", regression coefficeints are plotted. If it is "s", shrinkage (variance) parameters for the residual spatial process are plotted. Default is "b"
cex.main	Graphical parameter specifying the size of the main title
cex.lab	Graphical parameter specifying the size of the x and y axis labels
cex.axis	Graphical parameter specifying the size of the tick label numbers
lwd	Graphical parameters specifying the width of the line drawing the coefficient estimates

Note

See [par](#) for the graphical parameters

plot_s   *Mapping spatially and spatio-temporally varying coefficients*

Description

This function plots spatially varying coefficients (SVC) and spatio-temporally varying coefficients (STVC) with/without coefficient varying with respect to the value of the explanatory variable (NVC). Namely, the full varying coefficient equals STVC + NVC.

Usage

```
plot_s( mod, xnum = 0, btype = "all", xtype = "x", pmax = NULL, ncol = 8,
        col = NULL, inv =FALSE, brks = "regular", cex = 1, pch = 20,
        nmax = 20000, coords_z1_lim=NULL, coords_z2_lim = NULL)
```

Arguments

mod	Outpot from resf, besf, resf_vc, besf_vc, or addlearn_local function
xnum	For resf_vc, besf_vc, and addlearn_local, xnum-th SVC/STVC is plotted. If num = 0, varying intercept is plotted. For resf and besf, estimated spatially dependent residual process is plotted irrespective of the xnum value. Default is 0
btype	Effective if x_nvc =TRUE in resf_vc and besf_vc. If "all" (default), the estiamted varying coefficients (S(T)VC + NVC) are plotted as they are. If "svc", S(T)VC is plotted. If "nvc", NVC is plotted.
xtype	If "x" (default), coefficients on x is plotted. If "xconst", those on xconst is plotted
pmax	The maximum p-value for the varying coefficients to be displayed. For example, if pmax = 0.05, the only coefficients that are statistically significant at the 5 percent level are plotted. If NULL, all the coefficients are plotted. Default is NULL
ncol	Number of colors in the color palette. Default is 8
col	Color palette used for the mapping. If NULL, the blue-pink-yellow color scheme is used. Palettes in the RColorBrewer package are available. Default is NULL
inv	If TRUE, the color palett is inverted. Default is FALSE
brks	If "regular", color is changed at regular intervals. If "quantile", color is changed for each quantile
cex	Size of the dots representing sample sites
pch	A number indicating the symbol to use
nmax	If sample size exceeds nmax, nmax samples are randomly selected and plotted. Default is 20,000
coords_z1_lim	Value range for coords_z[,1] in the meigen/meigen_f function (vector). If is has two elements, the samples whose coords_z[,1] values are in between these values are plotted. If it is a scalar, samples satisfying coords_z[,1]==coords_z1_lim is plotted
coords_z2_lim	Value range for coords_z[,2] (vector).

---

predict0   *Spatial and spatio-temporal predictions*

Description

It is a function for spatial/spatio-temporal pprediction using the model estimated from esf, resf, or resf_vc function.

Usage

```
predict0( mod, meig0, x0 = NULL, xconst0 = NULL, xgroup0 = NULL, offset0 = NULL,
weight0 = NULL, compute_se=FALSE, compute_quantile = FALSE )
```

Arguments

mod   Output from esf resf

, or resf_vc

meig0   Moran eigenvectors at prediction sites. Output from meigen0

x0   Matrix of explanatory variables at prediction sites (N_0 x K). Each column of
               x0 must correspond to those in x in the input model (mod). Default is NULL

xconst0   Effective for resf_vc. Matrix of explanatory variables at prediction sites whose
               coefficients are assumed constant across space (N_0 x K_const). Each column
               of xconst0 must correspond to those in xconst in the input model. Default is
               NULL

xgroup0   Matrix/vector of group IDs at prediction sites that may be integer or name by
               group (N_0 x K_g). Default is NULL

offset0   Vector of offset variables at prediction sites (N_0 x 1). Effective if y is count
               (see nongauss_y). Default is NULL

weight0   Vector of weights for prediction sites (N_0 x 1). Required if compute_se =
               TRUE or compute_quantile = TRUE, and weight in the input model is not NULL

compute_se   If TRUE, predictive standard error is evaulated. It is currently supported only for
               continuous variables. If nongauss is specified in the input model (mod), standard
               error for the transformed y is evaluated. Default is FALSE

compute_quantile
               If TRUE, Matrix of the quantiles for the predicted values (N x 15) is evaulated.
               It is currently supported only for continuous variables. Default is FALSE

Value

pred	Matrix with the first column for the predicted values (pred). The second and the third columns are the predicted trend component (xb) and the residual spatial process (sf_residual). If xgroup0 is specified, the fourth column is the predicted group effects (group). If tr_num > 0 or tr_nonneg ==TRUE (i.e., y is transformed) in mod, there is another column of the predicted values in the transformed/normalized scale (pred_trans). In addition, if compute_quantile =TRUE, predictive standard error (pred_se) is evaluated and added as another column
pred_quantile	Effective if compute_quantile = TRUE. Matrix of the quantiles for the predicted values (N x 15). It is useful for evaluating uncertainty in the predictive values
b_vc	Matrix of estimated spatially (spatio-temporally) varying coefficients (S(T)VCs) on x0 (N_0 x K)
bse_vc	Matrix of estimated standard errors for the S(T)VCs (N_0 x K)
t_vc	Matrix of estimated t-values for the S(T)VCs (N_0 x K)
p_vc	Matrix of estimated p-values for the S(T)VCs (N_0 x K)

resf   *spatial and spatio-temporal regression models*

Description

This model estimates regression coefficients, coefficients varying depending on x (non-spatially
varying coefficients; NVC), and group effects, considering residual spatial/spatio-temporal depen-
dence. The random-effects eigenvector spatial filtering, which is an approximate Gaussian process
approach, is used for modeling the residual dependence. If nonugauss is specified, non-Gaussian
explained variables are Gaussianized using a compositional warping function (see nongauss_y).
This augument allows the resf function to be applied to non-Gaussian explained variables, includ-
ing count data.

Usage

```
resf( y, x = NULL, xgroup = NULL, weight = NULL, offset = NULL,
      nvc = FALSE, nvc_sel = TRUE, nvc_num = 5, meig,
      method = "reml", penalty = "bic", nongauss = NULL )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K). Default is NULL
xgroup	Matrix of group IDs. The IDs may be group numbers or group names (N x K_g). Default is NULL
weight	Vector of weights for samples (N x 1). If non-NULL, the adjusted R-squared value is evaluated for weighted explained variables. Default is NULL
offset	Vector of offset variables (N x 1). Available if y is count (y_type = "count" is specified in the nongauss_y function). Default is NULL

nvc	If TRUE, a non-linear function of x (NVC; a spline function) is used as a varying coefficient. If FALSE, constant coefficients are assumed. Default is FALSE
nvc_sel	If TRUE, type of each coefficient (NVC or constant) is selected through a BIC minimization. If FALSE, NVCs are assumed across x. Alternatively, nvc_sel can be given by column number(s) of x. For example, if nvc_sel = 2, the coefficient on the second explanatory variable is NVC and the other coefficients are constants. Default is TRUE
nvc_num	Number of natural spline basis functions to be used to model NVC. Default is 5
meig	Moran eigenvectors and eigenvalues. Output from meigen or meigen_f
method	Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"
penalty	Penalty to select type of coefficients (NVC or constant) to stablize the estimates. The current options are "bic" for the Baysian information criterion-type penalty (N x log(K)) and "aic" for the Akaike information criterion (2K). Default is "bic"
nongauss	Parameter setup for modeling non-Gaussian continuous data or count data. Output from nongauss_y

Details

For modeling non-Gaussian data including count data, see nongauss_y.

Value

b	Matrix with columns for the estimated constant coefficients on x, their standard errors, t-values, and p-values (K x 4)
b_g	List of K_g matrices with columns for the estimated group effects, their standard errors, and t-values
c_vc	Matrix of estimated NVCs on x (N x K). Effective if nvc = TRUE
cse_vc	Matrix of standard errors for the NVCs on x (N x K). Effective if nvc = TRUE
ct_vc	Matrix of t-values for the NVCs on x (N x K). Effective if nvc = TRUE
cp_vc	Matrix of p-values for the NVCs on x (N x K). Effective if nvc = TRUE
s	Vector of estimated variance parameters (2 x 1). The first and the second elements are the standard deviation and the Moran's I value of the estimated spatially (and temporally) dependent process, respectively. The Moran's I value is scaled to take a value between 0 (no spatial dependence) and 1 (the maximum possible spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
s_c	Vector of standard deviations of the NVCs on xconst
s_g	Vector of estimated standard deviations of the group effects
e	Error statistics. When y_type="continuous", it includes residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). rlogLik is replaced with log-likelihood (logLik) if method = "ml".

	resid_SE is replaced with the residual standard error for the transformed y (resid_SE_trans) if nongauss is specified. When y_type="count", the error statistics contains root mean squared error (RMSE), Gaussian likelihood approximating the model, AIC and BIC based on the likelihood, and the proportion of the null deviance explained by the model (deviance explained (%)). deviance explained, which is also used in the mgcv package, corresponds to the adjusted R2 in case of the linear regression
vc	List indicating whether NVC are removed or not during the BIC minimization. 1 indicates not removed whreas 0 indicates removed
r	Vector of estimated random coefficients on the Moran's eigenvectors (L x 1)
sf	Vector of estimated spatial dependent component (N x 1)
pred	Matrix of predicted values for y (pred) and their standard errors (pred_se) (N x 2). If y is transformed by specifying nongauss_y, the predicted values in the transformed/normalized scale are added as another column named pred_trans
pred_quantile	Matrix of the quantiles for the predicted values (N x 15). It is useful to evaluate uncertainty in the predictive value
tr_par	List of the parameter estimates for the tr_num SAL transformations. The k-th element of the list includes the four parameters for the k-th SAL transformation (see nongauss_y)
tr_bpar	The estimated parameter in the Box-Cox transformation
tr_y	Vector of the transformed explaied variables
resid	Vector of residuals (N x 1)
pdf	Matrix whose first column consists of evenly spaced values within the value range of y and the second column consists of the estimated value of the probability density function for y if y_type in nongauss_y is "continuous" and probability mass function (PMF) if y_type = "count". If offset is specified (and y_type = "count"), the PMF given median offset value is evaluated
skew_kurt	Skewness and kurtosis of the estimated probability density/mass function of y
other	List of other outputs, which are internally used

resf_qr   *Spatial filter unconditional quantile regression*

Description

This function estimates the spatial filter unconditional quantile regression (SF-UQR) model.

Usage

```
resf_qr( y, x = NULL, meig, tau = NULL, boot = TRUE,
         iter = 200, parallel=FALSE, ncores=NULL )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables (N x K). Default is NULL
meig	Moran eigenvectors and eigenvalues. Output from meigen or meigen_f
tau	The quantile(s) to be modeled. It must be a number (or a vector of numbers) strictly between 0 and 1. By default, tau = c(0.1, 0.2, ..., 0.9)
boot	If it is TRUE, confidence intervals of regression coefficients are estimated by a semiparametric bootstrapping. Default is TRUE
iter	The number of bootstrap replications. Default is 200
parallel	If TRUE, the bootstrapping for estimating confidence intervals is parallelized. Default is FALSE
ncores	Number of cores used for the parallel computation. If ncores=NULL, which is the default, the number of available cores - 2 is detected and used

Value

b	Matrix of estimated regression coefficients (K x Q), where Q is the number of quantiles (i.e., the length of tau)
r	Matrix of estimated random coefficients on Moran eigenvectors (L x Q)
s	Vector of estimated variance parameters (2 x 1). The first and the second elements denote the standard deviation and the Moran's I value of the estimated spatially dependent component, respectively. The Moran's I value is scaled to take a value between 0 (no spatial dependence) and 1 (the maximum possible spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked
e	Vector whose elements are residual standard error (resid_SE) and adjusted quasi conditional R2 (quasi_adjR2(cond))
B	Q matrices (K x 4) summarizing bootstrapped estimates for the regression coefficients. Columns of these matrices consist of the estimated coefficients, the lower and upper bounds for the 95 percent confidencial intervals, and p-values. It is returned if boot = TRUE

S	Q matrices (2 x 3) summarizing bootstrapped estimates for the variance parameters. Columns of these matrices consist of the estimated parameters, the lower and upper bounds for the 95 percent confidencial intervals. It is returned if boot = TRUE
B0	List of Q matrices (K x iter) summarizing bootstrapped coefficients. The q-th matrix consists of the coefficients on the q-th quantile. Effective if boot = TRUE
S0	List of Q matrices (2 x iter) summarizing bootstrapped variance parameters. The q-th matrix consists of the parameters on the q-th quantile. Effective if boot = TRUE

---

resf_vc	*spatial and spatio-temporal regression models with varying coefficients*

Description

This function estimates spatially varying coefficients (SVC) or spatio-temporally varying coefficients (STVC), group effects, considering residual spatial/spatio-temporal dependence. A non-linear function of x (NVC) can be added on each SVC/STVC mainly to stablize the estimation (see Murakami and Griffith, 2020). Approximate Gaussian processes based on Moran eigenvectors are used for modeling the spatio-temporal processes. Type of coefficients (constant or varying) is selected through a BIC minimization. If nonugauss is specified, non-Gaussian explained variables are Gaussianized using a compositional warping function (see [nongauss_y](#)). This augument allows the resf function to be applied to non-Gaussian explained variables, including count data.

Note that, for very large samples, this function can overlook small-scale spatial variations. [addlearn_local](#) applies an model aggregation/averaging technique to address this problem.

Usage

```
resf_vc(y, x, xconst = NULL, xgroup = NULL, weight = NULL, offset = NULL,
        x_nvc = FALSE, xconst_nvc = FALSE, x_sel = TRUE, x_nvc_sel = TRUE,
        xconst_nvc_sel = TRUE,
        nvc_num = 5, meig, method = "reml", penalty = "bic", nongauss = NULL,
        miniter=NULL, maxiter = 30, tol = 1e-30 )
```

Arguments

y	Vector of explained variables (N x 1)
x	Matrix of explanatory variables assuming SVC/STVC (N x K)
xconst	Matrix of explanatory variables assuming constant coefficients (N x K_c). Default is NULL
xgroup	Matrix of group IDs for modeling group-wise random effects. The IDs may be group numbers or group names (N x K_g). Default is NULL
weight	Vector of weights for samples (N x 1). If non-NULL, the adjusted R-squared value is evaluated for weighted explained variables. Default is NULL
offset	Vector of offset variables (N x 1). Available if y is count (y_type = "count" is specified in the [nongauss_y](#) function). Default is NULL
x_nvc	If TRUE, a non-linear function of x (NVC) is added on each varying coefficient on x to stablize the estimate. Default is FALSE
xconst_nvc	If TRUE, NVCs is added on each constant coefficient on xconst model estimate non-linear influence from xconst
x_sel	If TRUE, type of coefficient on x (STVC, SVC, or constant) is selected through a BIC minimization. If FALSE, S(T)VCs are assumed across x. Alternatively, x_sel can be given by column number(s) of x. For example, if x_sel = 2, the coefficient on the second explanatory variable is S(T)VC and the other coefficients are constants. The Default is TRUE

x_nvc_sel   If TRUE, with/without NVC on x is selected. If FALSE, NVCs are assumed across x. Alternatively, x_nvc_sel can be given by column number(s) of x. For example, if x_nvc_sel = 2, the coefficient on the second explanatory variable is NVC and the other coefficients are constants. The Default is TRUE

xconst_nvc_sel   If TRUE, with/without NVC on xconst is selected. If FALSE, NVCs are assumed across xconst. Alternatively, xconst_nvc_sel can be given by column number(s) of xconst. For example, if xconst_nvc_sel = 2, the coefficient on xconst[,2] becomes constant + NVC while the other coefficients become constants.The Default is TRUE

nvc_num   Number of natural spline basis functions to be used in NVC. Default is 5

meig   Moran eigenvectors and eigenvalues. Output from [meigen](#) or [meigen_f](#)

method   Estimation method. Restricted maximum likelihood method ("reml") and maximum likelihood method ("ml") are available. Default is "reml"

penalty   Penalty for model estimation and selection. "bic" for the Baysian information criterion-type penalty (N x log(K)) and "aic" for the Akaike information criterion (2K). Default is "bic"

nongauss   Parameter setup for modeling non-Gaussian continuous and count data. Output from [nongauss_y](#)

miniter   Minimum number of iterations. Default is NULL

maxiter   Maximum number of iterations. Default is 30

tol   The tolerance for matrix inversion. Some errors regarding singular fit can be avoided by reducing the value, but the output can be unstable. Default is 1e-30

Details

For modeling non-Gaussian data including count data, see [nongauss_y](#).

Value

b_vc   Matrix of estimated spatially/spatio-temporally varying coefficients (S(T)VC + NVC) on x (N x K)

bse_vc   Matrix of standard errors for the varying coefficients on x (N x k)

t_vc   Matrix of t-values for the coefficients on x (N x K)

p_vc   Matrix of p-values for the coefficients on x (N x K)

B_vc_s   List of the estimated S(T)VCs in b_vc (= S(T)VC + NVC). The elements are the S(T)VCs (N x K), the standard errors (N x K), t-values (N x K), and p-values (N x K), respectively

B_vc_n   List of the estimated NVCs in b_vc (= S(T)VC + NVC). The elements are the NVCs (N x K), the standard errors (N x K), t-values (N x K), and p-values (N x K), respectively

c   Matrix with columns for the estimated coefficients on xconst, their standard errors, t-values, and p-values (K_c x 4). Effective if xconst_nvc = FALSE

c_vc   Matrix of estimated NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE

cse_vc	Matrix of standard errors for the NVCs on xconst (N x k_c). Effective if xconst_nvc = TRUE
ct_vc	Matrix of t-values for the NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE
cp_vc	Matrix of p-values for the NVCs on xconst (N x K_c). Effective if xconst_nvc = TRUE
b_g	List of K_g matrices with columns for the estimated group effects, their standard errors, and t-values
s	List of the variance parameters for the varying coefficient on x. The first element is a 2 x K matrix summarizing variance parameters for S(T)VC. The (1, k)-th element is the standard deviation of the k-th SVC, while the (2, k)-th element is the Moran's I value that is scaled to take a value between 0 (no spatial dependence) and 1 (strongest spatial dependence). Based on Griffith (2003), the scaled Moran'I value is interpretable as follows: 0.25-0.50:weak; 0.50-0.70:moderate; 0.70-0.90:strong; 0.90-1.00:marked. The second element of s is the vector of standard deviations of the NVCs
s_c	Vector of standard deviations of the NVCs on xconst
s_g	Vector of standard deviations of the group effects
vc	List indicating whether S(T)VC/NVC are removed or not during the BIC minimization. 1 indicates not removed (replaced with constant) whreas 0 indicates removed
e	Error statistics. When y_type="continuous", it includes residual standard error (resid_SE), adjusted conditional R2 (adjR2(cond)), restricted log-likelihood (rlogLik), Akaike information criterion (AIC), and Bayesian information criterion (BIC). rlogLik is replaced with log-likelihood (logLik) if method = "ml". resid_SE is replaced with the residual standard error for the transformed y (resid_SE_trans) if nongauss is specified. When y_type="count", the error statistics includes root mean squared error (RMSE), Gaussian likelihood approximating the model, AIC and BIC based on the likelihood, and the proportion of the null deviance explained by the model (deviance explained (%)). deviance explained, which is also used in the mgcv package, corresponds to the adjusted R2 in case of the linear regression
pred	Matrix of predicted values for y (pred) and their standard errors (pred_se) (N x 2). If y is transformed by specifying nongauss_y, the predicted values in the transformed/normalized scale are added as another column named pred_trans
pred_quantile	Matrix of the quantiles for the predicted values (N x 15). It is useful to evaluate uncertainty in the predictive value
tr_par	List of the parameter estimates for the tr_num SAL transformations. The k-th element of the list includes the four parameters for the k-th SAL transformation (see nongauss_y)
tr_bpar	The estimated parameter in the Box-Cox transformation
tr_y	Vector of the transformed explaied variables
resid	Vector of residuals (N x 1)

pdf	Matrix whose first column consists of evenly spaced values within the value range of y and the second column consists of the estimated value of the probability density function for y if y_type in [nongauss_y](#) is "continuous" and probability mass function if y_type = "count". If offset is specified (and y_type = "count"), the PMF given median offset value is evaluated
skew_kurt	Skewness and kurtosis of the estimated probability density/mass function of y
other	List of other outputs, which are internally used

weigen   *Extract eigenvectors from a spatial weight matrix*

Description

This function extracts eigenvectors and eigenvalues from a spatial weight matrix.

Usage

```
weigen( x = NULL, type = "knn", k = 4, threshold = 0.25, enum = NULL )
```

Arguments

x	Matrix of spatial point coordinates (N x 2), sf polygon object (N spatial units), or an user-specified spatial weight matrix (N x N) (see Details)
type	Type of spatial weights. The currently available options are "knn" for the k-nearest neighbor-based weights, and "tri" for the Delaunay triangulation-based weights. If sf polygons are provided for x, type is ignored, and the rook-type neighborhood matrix is created
k	Number of nearest neighbors. It is used if type ="knn"
threshold	Threshold for the eigenvalues (scalar). Suppose that lambda_1 is the maximum eigenvalue. Then, this fucntion extracts eigenvectors whose corresponding eigenvalues are equal or greater than [threshold x lambda_1]. It must be a value between 0 and 1. Default is 0.25 (see Details)
enum	Optional. The muximum acceptable mumber of eigenvectors to be used for spatial modeling (scalar)

Details

If user-specified spatial weight matrix is provided for x, this function returns the eigen-pairs of the matrix. Otherwise, if sf polygon object is provided to x, the rook-type neighborhood matrix is created using this polygon, and eigen-decomposed. Otherwise, if point coordinats are provided to x, a spatial weight matrix is created according to type, and eigen-decomposed.

By default, the ARPACK routine is implemented for fast eigen-decomposition.

threshold = 0.25 (default) is a standard setting for topology-based ESF (see Tiefelsdorf and Griffith, 2007) while threshold = 0.00 is a usual setting for distance-based ESF.

Value

sf	Matrix of the first L eigenvectors (N x L)
ev	Vector of the first L eigenvalues (L x 1)
other	List of other outcomes, which are internally used
